direct term: $\partial W/\partial \varepsilon_t$
More CO_2 in the reservoirs, α fixed
Warming and damages, $s \geq t$
Emissions pulse in t
stocks and T_{AT} enter the IRF target
in later periods
SCC = direct + feedback
Carbon and temperature states change; α re-solved from IRF
Persistence of the whole stock changes; warming and damages
feedback term: $(\partial W/\partial \alpha)(d\alpha/d\varepsilon_t)$
